Team ID	SWTID-2026-6675
Project Name	Auto Ticket Classification Using Flow Designer
Maximum Marks	2 Marks

Customer Problem Statement:

IT support teams need an efficient way to automatically classify and route incoming service tickets, as manual classification requires additional time and effort and may result in incorrect assignment and delays in resolving issues.

I am	An IT support team member responsible for handling and managing service tickets.
I'm trying to	Quickly review, classify, prioritize, and assign incoming service tickets to the appropriate support team.
But	Many tickets are currently reviewed and categorized manually, which requires additional time and effort.
Because	The ticket classification and assignment process depends on manual identification of the issue type and appropriate support group.
Which makes me feel	Delayed in processing requests and concerned about incorrect classification, assignment, and slower issue resolution.

Example:

Problem Statement (PS)	I am (Customer)	I'm trying to	But	Because	Which makes me feel
PS-1	IT support member	Classify incoming IT tickets automatically	Ticket classification is done manually	Tickets contain different types of IT issues such as Wi-Fi, projector, password, and computer problems	Frustrated by repetitive work and delays
PS-2	IT support member	Assign the correct category and subcategory to each ticket	Incorrect classification can occur during manual processing	There is no automated rule-based classification process	Concerned about incorrect categorization and delayed ticket processing
