Project Design Phase
Problem – Solution Fit

Date	01 October 2026
Team ID	SWTID-2026-6675
Project Name	Auto Ticket Classification Using Flow Designer
Maximum Marks	2 Marks

Problem–Solution Fit:

The school IT helpdesk receives a large number of incident requests from students and teachers regarding common technical issues such as Wi-Fi connectivity problems, projector failures, password-related issues, and slow computer performance. At present, IT support staff manually review each incident, understand the reported issue, and select the appropriate category. As the number of requests increases, this manual process becomes time-consuming and increases the workload of the support staff. It may also result in inconsistent categorization or incorrect classification of incidents.

The proposed Auto Ticket Classification Using Flow Designer solution addresses this problem by automating the incident classification process. ServiceNow Flow Designer is used to create an automated workflow that evaluates the information provided in the Short Description and Description fields of an incident. The workflow identifies relevant keywords and applies predefined conditions to determine the appropriate category for the reported issue.

For example, an incident containing keywords related to Wi-Fi or network connectivity can be classified under the appropriate network-related category, while incidents containing keywords related to passwords, projectors, or slow computers can be classified according to their respective issue types. This reduces the need for IT staff to manually examine and categorize every incoming incident.

The proposed solution improves the consistency of the classification process by applying predefined rules to similar types of incidents. It also reduces repetitive manual activities and allows IT support staff to concentrate on resolving technical issues rather than spending excessive time on ticket categorization. The classification rules can be modified or extended when new types of IT support issues are introduced.

Furthermore, the solution provides a simple, maintainable, and scalable approach for managing incident requests. As the volume of support tickets increases, automated classification can help the helpdesk handle requests more efficiently without significantly increasing manual workload.

Therefore, the proposed Auto Ticket Classification Using Flow Designer provides a suitable solution to the identified problem by connecting the need for faster and consistent incident classification with an automated workflow. It helps reduce manual effort, improve classification accuracy, support efficient ticket processing, and enhance the overall effectiveness of the school IT helpdesk.

Problem-Solution fit canvas 2.0

Purpose / Vision: To automate the classification of school IT helpdesk incidents and reduce the time and effort required for manual ticket categorization.

Define CS, fit into CC

1. CUSTOMER SEGMENT(S) — CS

Who is your customer?

- School IT helpdesk staff
- IT support team members
- Staff responsible for handling incident tickets from students and teachers
- Departments receiving IT support services (students and teachers as end users)

6. CUSTOMER CONSTRAINTS — CC

What constraints prevent your customers from taking action or limit their choices of solutions?

- Large number of incident requests daily
- Limited IT staff availability
- Limited time for manual ticket review
- Different types of IT issues (Wi-Fi, projector, password, etc.)
- Need for a simple and easily maintainable automation solution
- Dependence on manual identification of issue type

5. AVAILABLE SOLUTIONS — AS

Which solutions are available to the customers when they face the problem? What have they tried in the past? What are the pros & cons?

- Manual ticket classification by IT staff
- Manual selection of category and subcategory
- Manual review of Short Description and Description
- Basic ticket assignment based on staff decisions

Limitations:

- Time-consuming and requires additional effort
- May lead to inconsistent or incorrect classification
- Not scalable as the number of requests increases

Explore AS, differentiate

Focus on J&P, tap into BE, understand RC

2. JOBS-TO-BE-DONE / PROBLEMS — J&P

Which jobs-to-be-done (or problems) do you address for your customers?

- Review incoming incident requests from students and teachers
- Identify the type of IT issue (Wi-Fi, projector, password, slow computers, etc.)
- Categorize incidents correctly
- Assign the ticket to the appropriate support team
- Reduce the time spent on manual classification
- Handle increasing numbers of support requests efficiently

9. PROBLEM ROOT CAUSE — RC

What is the real reason that this problem exists?
What is the back story behind the need to do this job?

- There is no automated classification process.
- IT staff must manually review the incident's Short Description and Description to identify the issue type.
- The helpdesk receives a high volume of diverse requests, making manual classification time-consuming.
- Manual identification may lead to incorrect categorization and delays in ticket routing.
- The process depends on individual staff decisions and is not consistent.

7. BEHAVIOUR — BE

What does your customer do to address the problem and get the job done?

- Receives incident tickets from students and teachers
- Reads the Short Description and Description fields
- Identifies the issue type manually
- Selects the appropriate category and subcategory
- Assigns the ticket to the correct support team
- Updates the ticket and informs the caller
- Handles a large number of requests throughout the day

Focus on J&P, tap into BE, understand RC

Identify strong TR & EM

3. TRIGGERS — TR

What triggers customers to act?

- Large number of incident requests from students and teachers
- Repetitive manual classification
- Increase in IT support workload
- Delays in processing tickets
- Incorrect ticket categorization
- Need for faster and more consistent ticket routing

4. EMOTIONS: BEFORE / AFTER — EM

How do customers feel when they face a problem or a job and afterwards?

- **Before:** Frustrated, stressed, worried about delays, and burdened by repetitive manual work.
- **After:** More confident, satisfied, and relieved with faster, consistent and accurate ticket classification.

10. YOUR SOLUTION — SL

If you are working on an existing business, write down your current solution first, then write your value proposition.

Auto Ticket Classification Using Flow Designer

A ServiceNow Flow Designer solution that analyzes keywords in the incident's Short Description and Description fields. Based on predefined conditions, the system automatically identifies the appropriate issue category and updates the incident record.

Key Benefits:

- Reduces manual effort
- Speeds up ticket classification
- Provides consistent and accurate categorization
- Handles repetitive classification automatically
- Easy to maintain and modify

8. CHANNELS of BEHAVIOUR — CH

8.1 ONLINE

What kind of actions do customers take online?

- ServiceNow incident portal
- Online ticket submission by students and teachers
- Incident descriptions and support requests

8.2 OFFLINE

What kind of actions do customers take offline?

- Direct requests from students and teachers
- Discussions with IT support staff
- Phone or in-person support requests

Extract online & offline CH of BE
