Project Design Phase
Proposed Solution

Date	01 October 2026
Team ID	SWTID-2026-6675
Project Name	Auto Ticket Classification Using Flow Designer
Maximum Marks	2 Marks

Proposed Solution :

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	The school IT helpdesk receives multiple incident requests from students and teachers related to Wi-Fi connectivity, projector failures, password problems, and slow computers. Currently, IT staff manually review each incident and select the appropriate category. This process is time-consuming, increases workload, and may result in incorrect or inconsistent ticket classification.
2.	Idea / Solution description	The proposed solution uses ServiceNow Flow Designer to automatically classify newly created incident tickets. The system analyzes keywords in the Short Description and Description fields and applies predefined conditions to identify the appropriate incident category. This reduces manual classification and improves the efficiency of ticket processing.
3.	Novelty / Uniqueness	The solution provides an automated and rule-based approach to classifying school IT helpdesk incidents. It uses keywords from incident descriptions and predefined Flow Designer conditions to perform classification automatically. The rules can be easily modified or extended when new types of IT issues are introduced.
4.	Social Impact / Customer Satisfaction	The solution helps IT support staff process incidents more quickly and consistently. Students and teachers can benefit from faster handling of their support requests. Reducing repetitive manual work also allows IT staff to focus more on resolving technical issues and improving the overall support experience.
5.	Business Model (Revenue Model)	The project is primarily designed as an internal IT service automation solution for educational institutions. It can be implemented as part of an organization's existing ServiceNow environment. For wider

		adoption, the solution can be customized and provided as an IT service automation package for schools and other organizations.
6.	Scalability of the Solution	The solution can be scaled by adding new keywords, categories, subcategories, and classification conditions to the Flow Designer workflow. It can also be extended to handle additional IT issues and larger volumes of incident requests. The same approach can be adapted for other departments and organizations requiring automated ticket classification.
