Project Design Phase
Solution Architecture

Date	01 October 2026
Team ID	SWTID-2026-6675
Project Name	Auto Ticket Classification Using Flow Designer
Maximum Marks	4 Marks

Solution Architecture:

The proposed solution begins when a student or teacher submits an IT incident request through the ServiceNow platform. The incident contains information such as the Short Description and Description, which provide details about the reported issue.

When a new incident is created, ServiceNow Flow Designer automatically triggers the classification workflow. The workflow examines the incident information and checks for predefined keywords and conditions related to common IT issues, such as Wi-Fi connectivity, projector problems, password issues, and slow computers.

Based on the identified keywords, Flow Designer determines the appropriate incident category and updates the corresponding incident record. This automated classification reduces the need for IT support staff to manually review and categorize every incoming request.

After classification, the updated incident is available to the IT support team for further processing and resolution. The architecture therefore provides a simple flow from incident submission → automated analysis → classification → incident update → IT support processing.
